

Sofic and hyperlinear groups and the logic for metric structures

October 2nd, 2013
Geometry and Analysis on Groups Seminar
University of Vienna

I will discuss how sofic and hyperlinear groups admit natural characterizations in the framework of logic for metric structures. As an application I will show how one can obtain with model-theoretic tools easier proofs of several fundamental results about sofic and hyperlinear groups, such as Kaplansky's direct finiteness conjecture and the algebraic eigenvalues conjecture for sofic groups, and Kervaire-Laudenbach conjecture for hyperlinear groups.
